What is claimed is:

1. (Currently amended) A method of routing a wireless signal between two points, said method comprising the steps of:

transmitting a wireless signal from an originating transmitter;

receiving said wireless signal at a first set of repeating transceivers;

in each said repeating transceiver, delaying said wireless signal by at least one predetermined delay and retransmitting said wireless signal;

such pre-determined delays in such transceivers being calculated to cause a desired alignment in time of arrival of such re-transmitted wireless signals at a destination receiver; and

receiving said re-transmitted wireless signals at said destination receiver.

- 2. (Original) The method of claim 1, wherein the signal received at each said repeating transceiver is mixed to an intermediate frequency before said re-transmitting.
- 3. (Original) The method of claim 1, wherein the signal received at each said repeating transceiver is digitized before said re-transmitting.
- 4. (Original) The method of claim 1, wherein the signal received at each said repeating transceiver is processed through an FIR filter before said re-transmitting.
- 5. (Original) The method of claim 1, wherein the signal received at each said repeating transceiver is converted to an analog signal before said re-transmitting.

- 6. (Original) The method of claim 1, wherein the signal received at each said repeating transceiver is up-shifted in frequency before said re-transmitting.
- 7. (Original) The method of claim 1, wherein said predetermined delay is programmable.

8-14. (Withdrawn)

15. (Currently amended) A transceiver for use in a system for dynamically routing wireless signals, said transceiver comprising:

means for receiving a wireless signal;

means for modulating said wireless signal, said modulating means coupled to said receiving means;

means for digitizing said wireless signal, said digitizing means coupled to said modulating means;

means for delaying transmission of said wireless signal by a dynamically adjustable delay, said delaying means coupled to said digitizing means;

means for amplifying said wireless signal, said amplifying means coupled to said delaying means; and

means for transmitting said wireless signal, said transmitting means coupled to said amplifying means.

16. (Original) A method of routing a wireless signal between two points, said method comprising the steps of:

transmitting a wireless signal as a plurality of wireless signals;

receiving said plurality of wireless signals at a repeating transceiver as a received plurality of wireless signals;

in said repeating transceiver, delaying each of said plurality of wireless signals by a separately predetermined delay to produce a set of delayed wireless signals;

combining said delayed wireless signals into a reconstituted wireless signal; and

re-transmitting said reconstituted wireless signal.

- 17. (Original) The method of claim 16, wherein each of said received plurality of wireless signals is mixed to an intermediate frequency before being delayed by said separately predetermined delay.
- 18. (Original) The method of claim 16, wherein each wireless signal received at each said repeating transceiver is digitized before said re-transmitting.
- 19. (Original) The method of claim 16, wherein each wireless signal received at each said repeating transceiver is processed through an FIR filter before said retransmitting.
- 20. (Original) The method of claim 16, wherein each wireless signal received at each said repeating transceiver is converted to an analog signal before said retransmitting.
- 21. (Original) The method of claim 16, wherein said reconstituted wireless signal at each said repeating transceiver is up-shifted in frequency before said retransmitting.
- 22. (Original) The method of claim 16, wherein each of said separately predetermined delays is programmable.
